 https://portfolio.emperordanivn.com

Senior Full-Stack Developer with 7+ years of experience building production Node.js, TypeScript, React, and cloud-native systems. Led a 6-developer team delivering mission-critical products used by 1,000+ users, owning backend architecture, frontend integration, code reviews, release planning, and production deployment. Strong in REST APIs, distributed systems, Docker, Kubernetes, SQL/MySQL, MongoDB, Redis, and AI-assisted engineering with GPT, OpenAI Codex, Claude, MCP servers, developer plugins, AI code reviews, debugging, refactoring, test generation, and implementation planning.

EDUCATION

The Open University
MBA in economics
2024 - 2026

Ariel University
B.Sc. Mathematics & Computer Science (Cybersecurity major)
2018-2021

Skills

Backend & Architecture

- Node.js
- TypeScript
- Express
- REST APIs
- Microservices

Full-Stack & Frontend

- React
- Frontend Integration
- API Contracts

Cloud & Infrastructure

- AWS
- Docker
- Kubernetes
- CI/CD
- Release Management

Data & Performance

- MySQL / SQL
- MongoDB
- Redis
- API Optimization

AI-Assisted Development

- GPT / ChatGPT
- OpenAI Codex
- Claude
- MCP Servers
- Developer Plugins
- AI Code Reviews
- Prompt Engineering

Leadership

- System Design
- Code Reviews
- Mentoring
- Technical Planning

EXPERIENCE

Dynamic Web

Full-Stack Developer (2021–2022)

- Delivered client-facing full-stack web applications by building Node.js/Express APIs, React interfaces, database integrations, and deployment-ready application flows.
- Improved product-delivery speed by creating reusable TypeScript service layers, REST API patterns, SQL/MySQL-compatible data models, MongoDB integrations, and secure backend modules.
- Improved application stability by refactoring backend bottlenecks, optimizing database access patterns, simplifying repeated client workflows, and improving frontend-backend communication.

IDF

Full-Stack Engineer (2020–2024)

- Built and maintained production full-stack systems supporting 1,000+ users by implementing Node.js, TypeScript, Express, REST APIs, React integrations, SQL/MySQL-compatible schemas, MongoDB-backed data flows, and secure API patterns.
- Delivered multiple end-to-end product features from requirements to production by translating stakeholder needs into backend services, frontend integration contracts, deployment plans, and production support workflows.
- Improved maintainability and release confidence across production systems by refactoring backend logic, simplifying API structure, strengthening validation flows, and using AI-assisted code review, debugging, and refactoring workflows across repeated releases.
- Increased reliability of real-time operational data flows by designing event-driven service interactions, validation logic, large database access patterns, and resilient communication between distributed services.
- Improved release readiness by supporting Docker and Kubernetes-based environments, conducting release reviews, validating deployments after production rollout, and reducing avoidable operational risk.

IDF

Full-Stack Team Lead (2024–2026)

- Accomplished end-to-end delivery of production full-stack systems used by 1,000+ operational users by owning feature planning, backend architecture, frontend integration, code reviews, release coordination, and post-deployment validation.
- Improved engineering quality across a 6-developer team by providing technical leadership, architecture guidance, mentoring, and clean, maintainable TypeScript/Node.js code-review standards.
- Delivered mission-critical backend features by designing REST APIs, service boundaries, validation logic, data flows, and database access patterns across SQL/MySQL-compatible databases, MongoDB, and Redis.
- Reduced production release risk by refactoring fragile service flows, tightening API structure, and standardizing release-management practices across repeated deployments.
- Improved performance for large operational workflows by optimizing REST API paths, database queries, service communication, and Redis-based caching for low-latency reads.
- Accelerated feature delivery and improved code quality by using GPT, OpenAI Codex, Claude, MCP servers, and developer plugins for architecture exploration, AI code reviews, debugging, refactoring, test generation, and implementation planning.
